Learning under Concept Drift: A Review

Jie Lu, *Fellow, IEEE*, Anjin Liu, *Member, IEEE*, Fan Dong, Feng Gu, João Gama, and Guangquan Zhang

Abstract—Concept drift describes unforeseeable changes in the underlying distribution of streaming data over time. Concept drift research involves the development of methodologies and techniques for drift detection, understanding and adaptation. Data analysis has revealed that machine learning in a concept drift environment will result in poor learning results if the drift is not addressed. To help researchers identify which research topics are significant and how to apply related techniques in data analysis tasks, it is necessary that a high quality, instructive review of current research developments and trends in the concept drift field is conducted. In addition, due to the rapid development of concept drift in recent years, the methodologies of learning under concept drift have become noticeably systematic, unravelling a framework which has not been mentioned in literature. This paper reviews over 130 high quality publications in concept drift related research areas, analyzes up-to-date developments in methodologies and techniques, and establishes a framework of learning under concept drift including three main components: concept drift detection, concept drift understanding, and concept drift adaptation. This paper lists and discusses 10 popular synthetic datasets and 14 publicly available benchmark datasets used for evaluating the performance of learning algorithms aiming at handling concept drift. Also, concept drift related research directions are covered and discussed. By providing state-of-the-art knowledge, this survey will directly support researchers in their understanding of research developments in the field of learning under concept drift.

Types de dérivation de concept

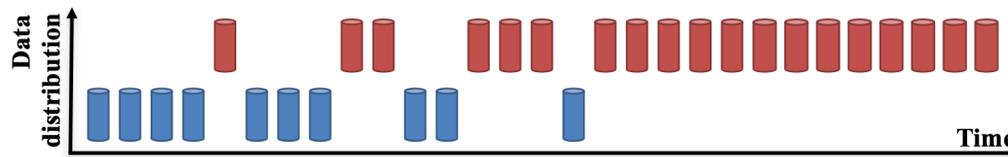

Sudden Drift:

A new concept occurs within a short time.

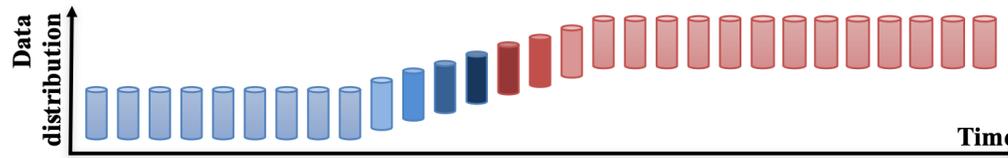

Gradual Drift:

A new concept gradually replaces an old one over a period of time.

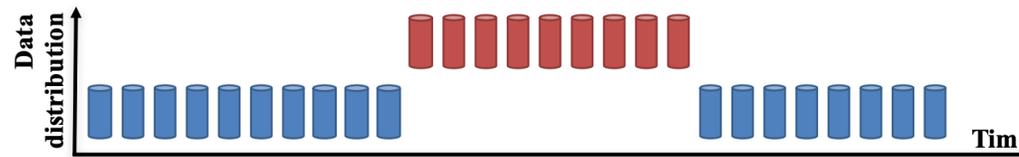

Incremental Drift:

An old concept incrementally changes to a new concept over a period of time.

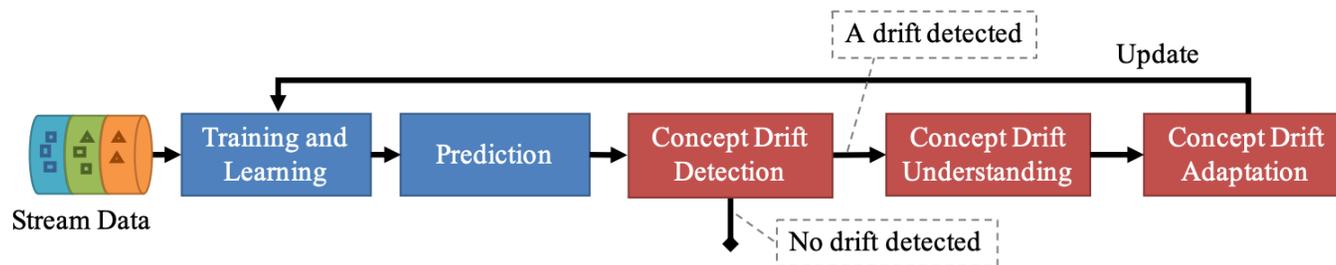

Reoccurring Concepts:

An old concept may reoccur after some time.

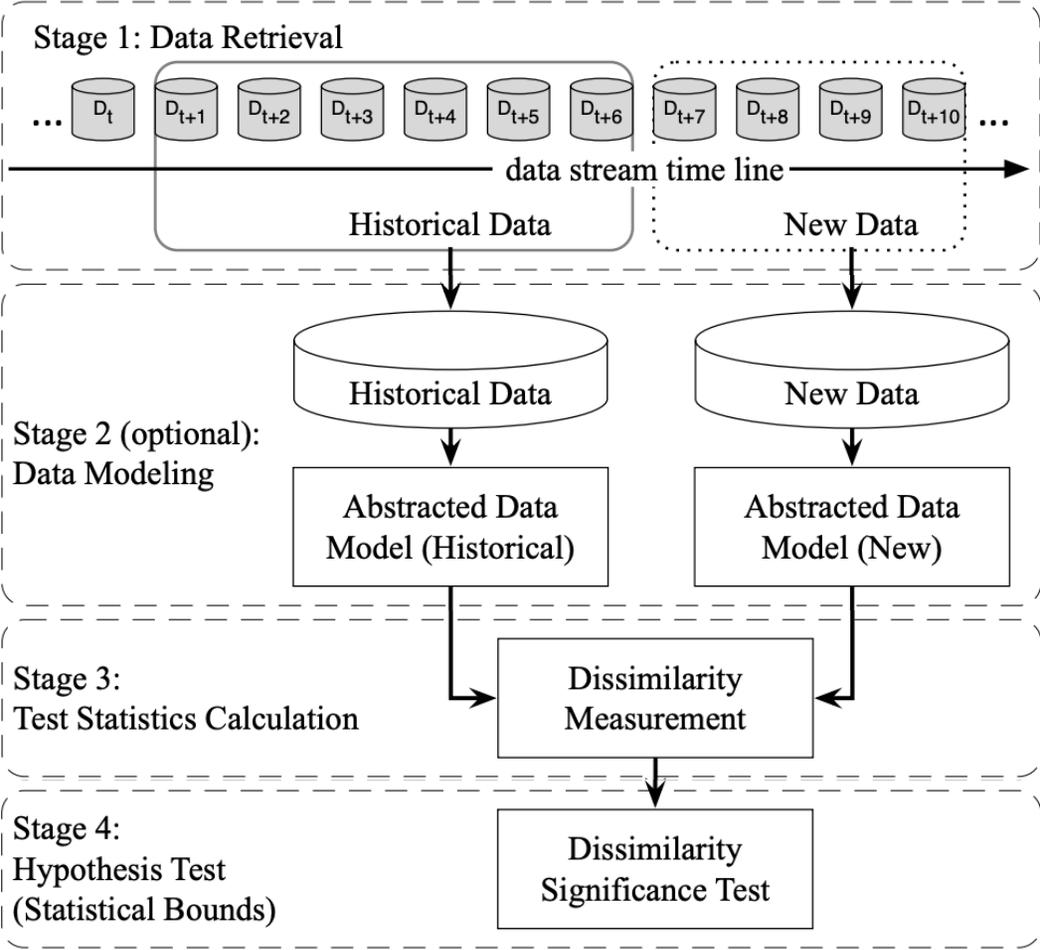

Gestion de la dérive de concept

L'article se concentre sur trois tâches principales liées à la dérive

- Identifier la dérive de concept
 - Se produit-elle ?
- Comprendre la dérive de concept
 - Pourquoi se produit-elle ?
- Réagir à la dérive de concept
 - Comment garantir la qualité de notre système d'IA au fil du temps ?

Identifier la dérive de concept

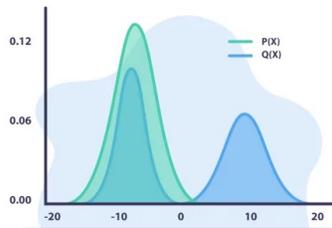

Identifier la dérive de concept (cont.)

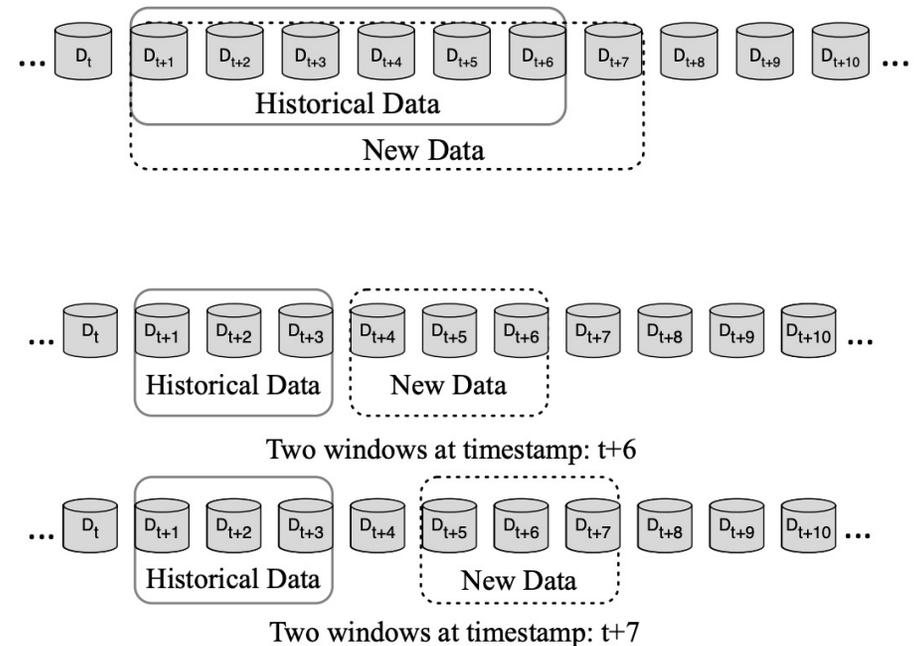

Méthodes basées sur l'erreur

- Drift Detection Method (DDM)
 - Calculer le taux d'erreur
 - Un taux d'erreur élevé déclenche un nouveau modèle

- Méthodes basées sur la distribution

Kullback-Leibler Divergence

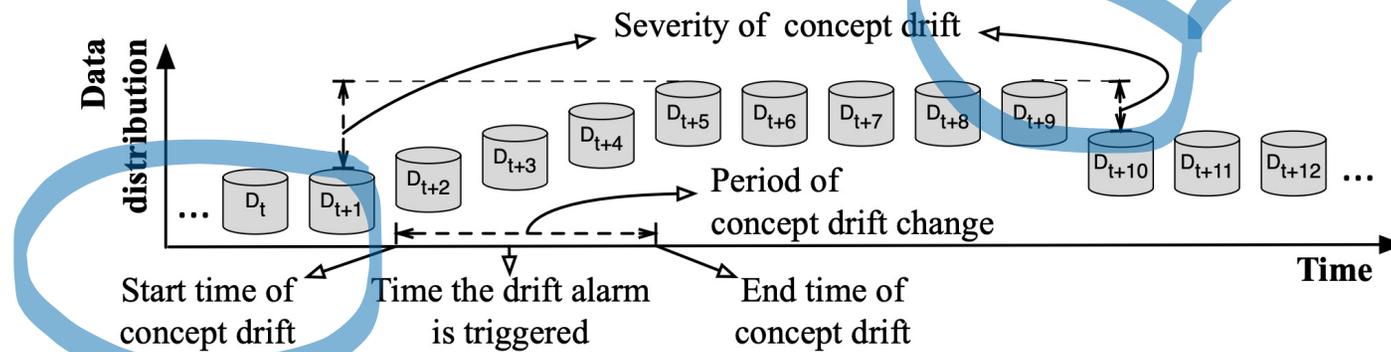

Identifier la dérivation de concept (cont.)

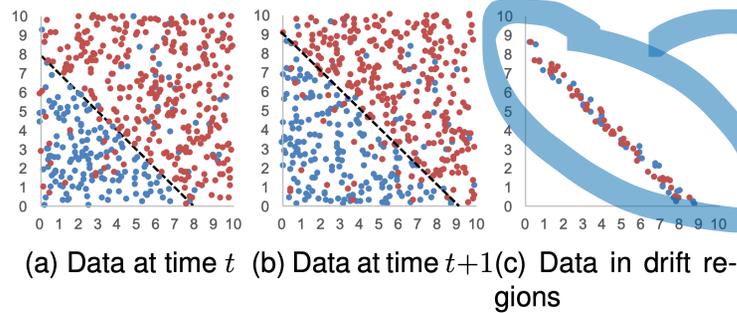

| Category | Algorithms | Stage 1 | Stage 2 | Stage 3 | Stage 4 | |
|-------------------------|---------------------------|--|--------------------------|--------------------------------|--|-------------------------|

Réagir à la dérive : Apprentissage en binôme

- Paired learners (Apprentissage en binôme)
 - Apprenant stable : entraîné sur de vieilles données
 - Apprenant réactif : entraîné sur de nouvelles données.
 - Changement lorsque l'erreur de l'apprenant stable > apprenant réactif."

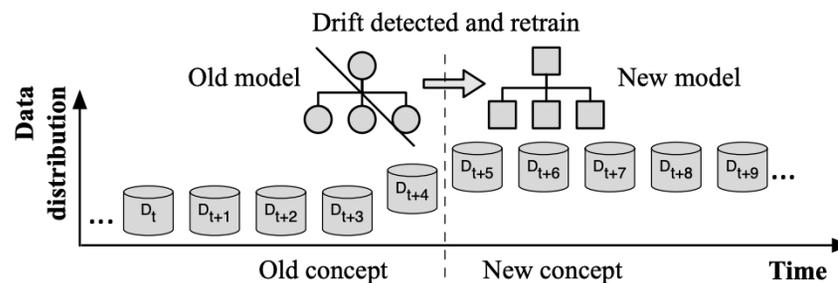

Fig. 13. A new model is trained with latest data to replace the old model when a concept drift is detected.

Réagir à la dérive : Modèles en ensemble

- Modèles en ensemble
 - Ideal pour la dérive récurrente
 - Inclure un nouveau modèle dans l'ensemble une fois qu'une dérive est identifiée
 - Le nouveau modèle classifie mieux les nouveaux concepts.

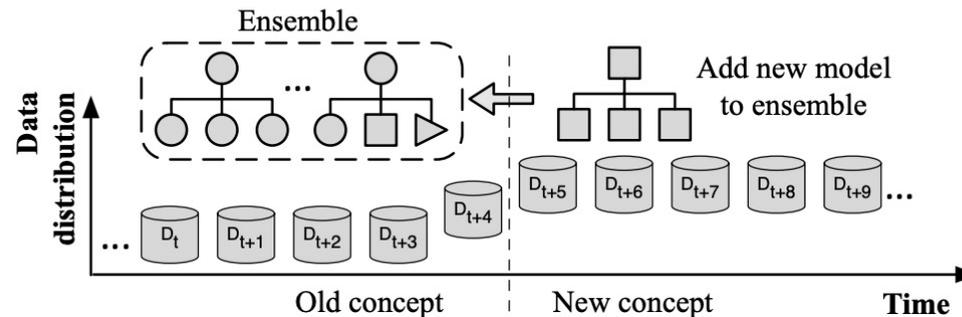

Fig. 14. A new base classifier is added to the ensemble when a concept drift occurs.

Conclusions

Un article d'introduction incontournable sur la dérive de concept.

- Présente un aperçu des méthodes.

Défis futurs :

- La compréhension de la dérive de concept est encore limitée.
- Les méthodes actuelles reposent sur des hypothèses irréalistes.
- Les méthodes supposent la présence de données étiquetées.
 - Les données étiquetées sont coûteuses et ne sont pas toujours possibles à obtenir dans un court laps de temps.

Problèmes et Solutions

Learning under Concept Drift: A Review

Jie Lu, *Fellow, IEEE*, Anjin Liu, *Member, IEEE*, Fan Dong, Feng Gu, João Gama, and Guangquan Zhang

Abstract—Concept drift describes unforeseeable changes in the underlying distribution of streaming data over time. Concept drift research involves the development of methodologies and techniques for drift detection, understanding and adaptation. Data analysis has revealed that machine learning in a concept drift environment will result in poor learning results if the drift is not addressed. To help researchers identify which research topics are significant and how to apply related techniques in data analysis tasks, it is necessary that a high quality, instructive review of current research developments and trends in the concept drift field is conducted. In addition, due to the rapid development of concept drift in recent years, the methodologies of learning under concept drift have become noticeably systematic, unravelling a framework which has not been mentioned in literature. This paper reviews over 130 high quality publications in concept drift related research areas, analyzes up-to-date developments in methodologies and techniques, and establishes a framework of learning under concept drift including three main components: concept drift detection, concept drift understanding, and concept drift adaptation. This paper lists and discusses 10 popular synthetic datasets and 14 publicly available benchmark datasets used for evaluating the performance of learning algorithms aiming at handling concept drift. Also, concept drift related research directions are covered and discussed. By providing state-of-the-art knowledge, this survey will directly support researchers in their understanding of research developments in the field of learning under concept drift.

Continuous Delivery for Machine Learning

Automating the end-to-end lifecycle of Machine Learning applications

Causé par des facteurs externes.
Imprevisible.
Nécessite une surveillance.

Quelle est la différence entre la
dérive de concept et la
dérive de la performance du modèle ?

- Peut être causé par des facteurs externes (dérive de concept).
Peut également être causé par des facteurs internes.
- Qualité du code (bugs) + qualité des données (valeurs aberrantes) + ..
 - Nécessite de bonnes pratiques (tests + déploiement).

MLOps = DevOps + AI systems

MLOps est une **culture** et **pratique** d'ingénierie ML visant à unifier le **développement de systèmes ML** (Dev) et **l'exploitation de systèmes ML** (Ops).

- Promouvoir l'automatisation et la surveillance à toutes les étapes du système ML

DevOps vs MLOps

Les pratiques DevOps offrent de nombreux avantages.

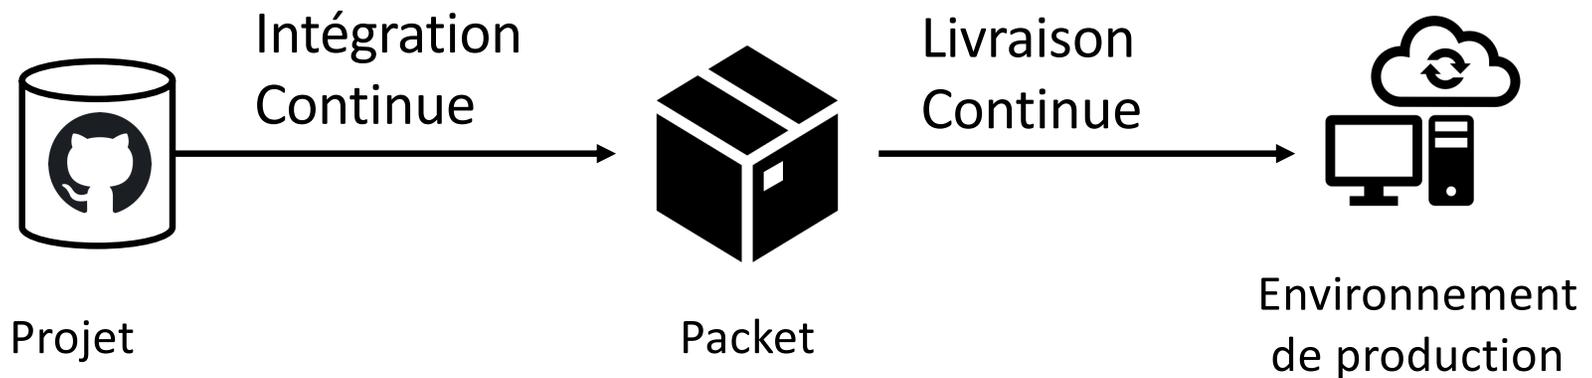

- Réduction des cycles de développement.
- Augmentation de la vitesse de développement.
- Augmentation des déploiements fiables

- Deux pratiques principales

- Intégration Continue (CI)
- Livraison Continue (CD)

Quelle est la différence ?

Intégration Continue (CI) vs Livraison Continue (CD)

Les systèmes ML sont différents des systèmes traditionnels

Les systèmes ML ont toute la complexité des systèmes traditionnels plus:

- L'équipe de développement est multidisciplinaire.
- Le développement est de nature expérimentale.
 - La reproductibilité est un défi.
- Les tests incluent également la validation des données, les tests de qualité du modèle, etc.
- Le déploiement est plus complexe.
 - Comprend une chaîne pour re-entraîner et déployer automatiquement les modèles.
- *Distinction non précise entre environnements de DEV & de PROD*

Les pratiques de MLOps

- Intégration Continue (CI)
 - Test et validation du code et des composants
 - Test et validation des données + des schémas de données + des modèles
- Déploiement Continu (CD)
 - Déploiement de packages et de services
 - Déploiement du pipeline de maintenance (re-entraînement du modèle)
- Formation continue (CT)
 - Réentraînement automatique des modèles

Propre aux systèmes ML !

Niveaux de maturité des MLOps

- **Niveau 0 : Processus manuel**

- La chaîne de traitement de ML est entièrement manuelle
- Aucune pratique de CI/CD - les changements fréquents ne sont pas supposés

- **Niveau 1 : Automatisation du pipeline de traitement de ML**

- Le réentraînement est automatisé

- **Niveau 2 : Automatisation du pipeline CI/CD**

Niveau 0 : Processus manuel

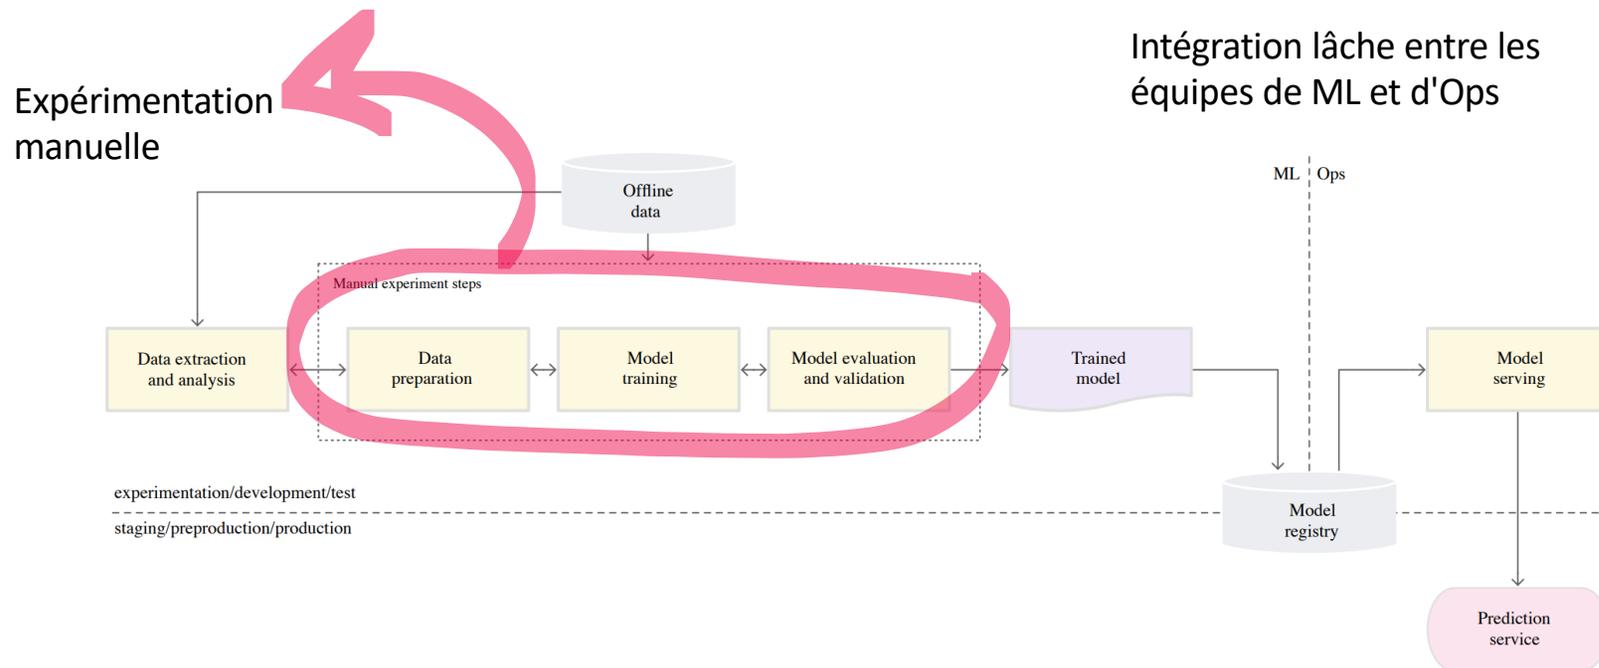

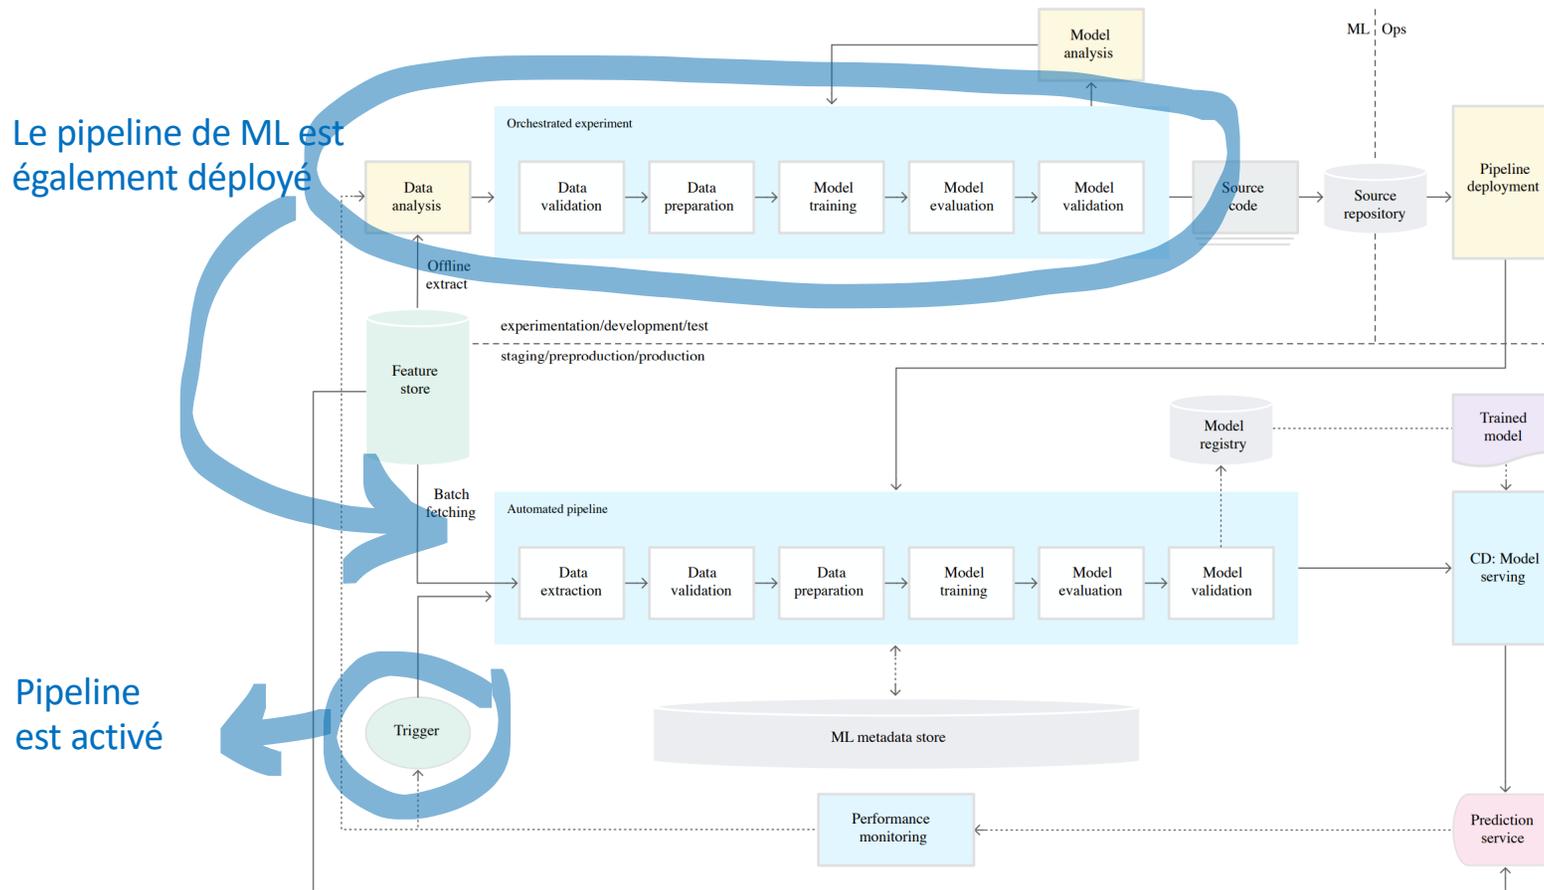

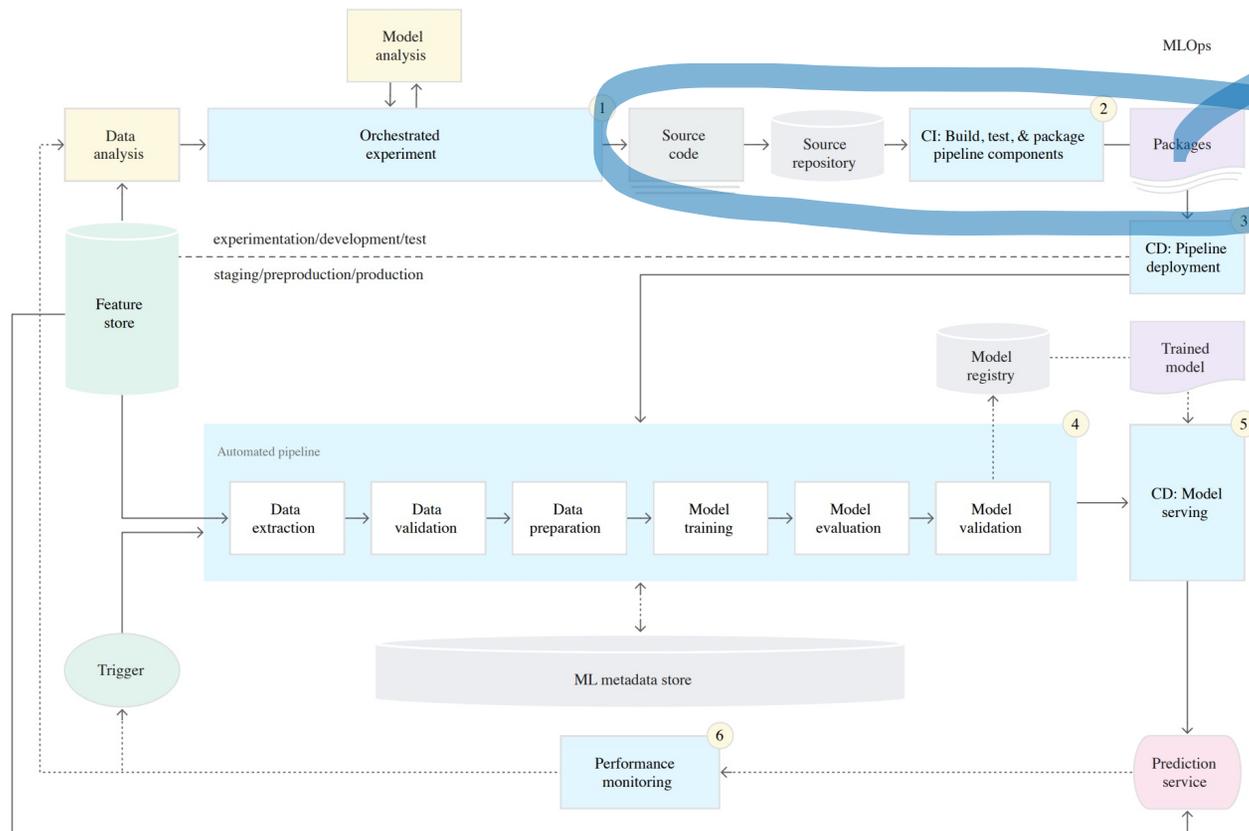

Figure 2. Manual ML steps to serve the model as a prediction service.

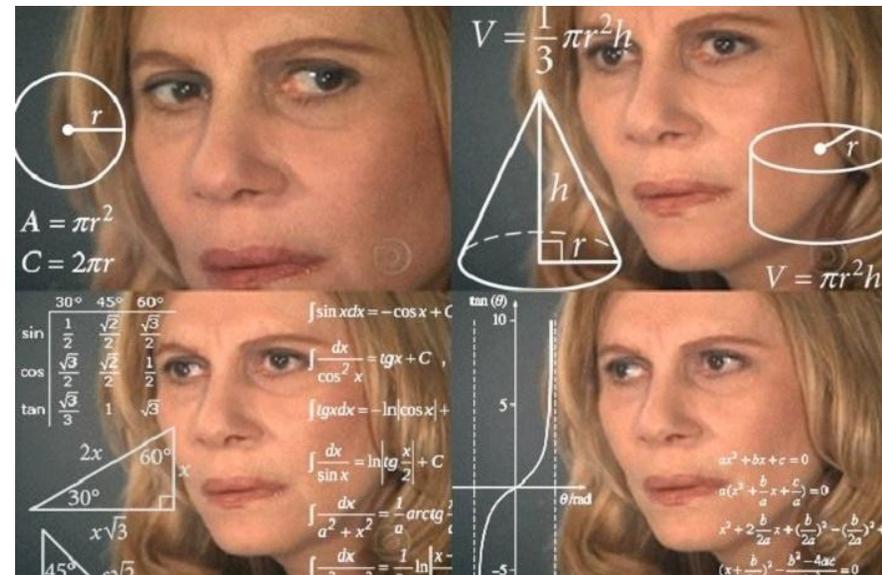

Level 1: Automatisation du pipeline de CT

Level 2: Automatisation du pipeline CI/CD

CI + CD of the ML pipelines

Abstrait ? Plongeons plutôt dans un exemple concret de système ML.
